QA Audit - Issue Review & Fixes

Ananta Graphics website and CMS - response to 'Ananta_Graphics_QA_Audit_Issues_final.pdf'

Every one of the 36 points in the audit was checked against the code and in the browser (desktop 1440 px and phone 390 px). Each original audit page is reproduced below, followed by the verdict for every issue on it: whether it was really there, what caused it, and what was changed. Screenshots of the result are at the end.

Result	Issues
Fixed	25
Partly a bug – fixed	8
Not a code bug – CMS content	1
Not reproducible / not a bug	2

Actions needed from your side

Code changes reach the live site after the next deploy. These items are settings or content, not code:

• **Server:** in `backend/.env` set `REVALIDATE_URL=http://127.0.0.1:3100/api/revalidate` and restart the API (`pm2 restart ag-api ag-admin-api`). Without this, CMS edits take hours to show on the live site (page 9).

• **CMS > Services:** add Packaging Solutions, Printed Materials, Signage & Display, Brand Identity, Pouches and Corporate Gifting; delete 'Demo' (pages 4 and 16).

• **CMS > Settings > Social media:** replace the generic home-page links with the company's own Instagram / Facebook / LinkedIn / YouTube pages (pages 6 and 9).

• **CMS > Settings > Contact details:** confirm the phone number; if 77336 51240 isn't the office number, enter the real one (page 4).

• **Re-test animations** with iPhone 'Reduce Motion' / Windows 'Animation effects' turned off - with them on, moving sections stay still by design (page 2).

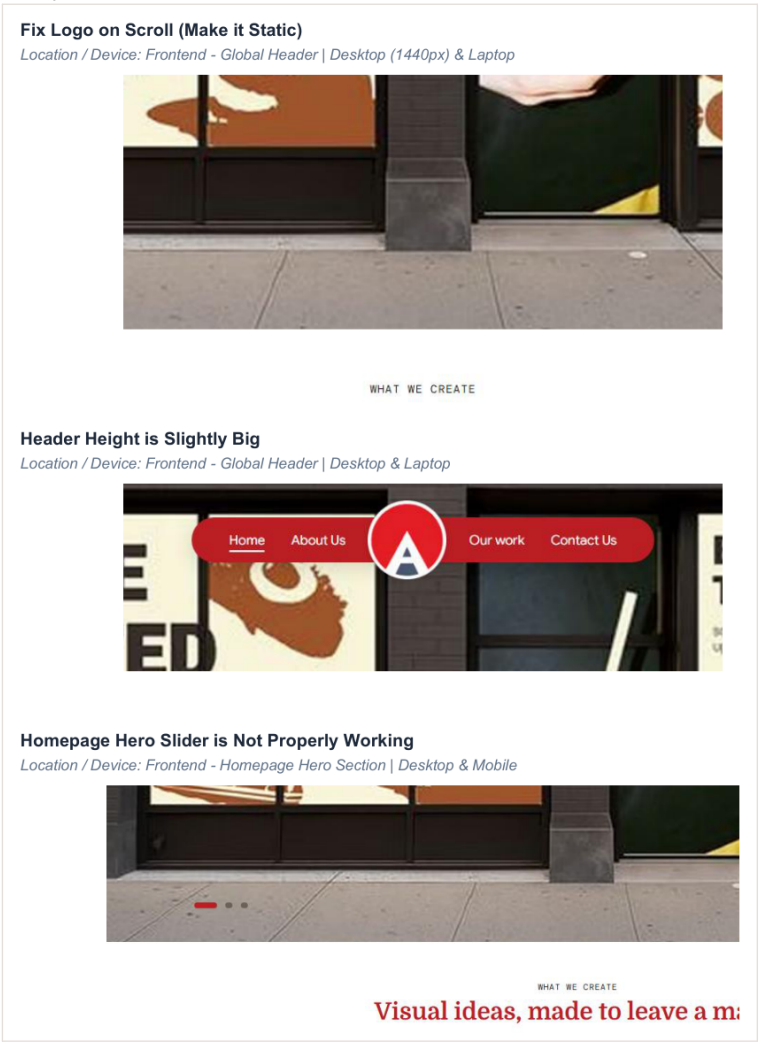

Also found and fixed during the review (not in the audit)

• **CMS 'Save SMTP Settings' never saved.** The button always failed (the save went to the wrong server route), so enquiry-alert emails could not be set up from the CMS. Fixed and covered by a test; verified saving and reloading in the CMS.

• **Email settings form** loaded its values in a way the code checker flagged; reworked so the saved values show immediately. The CMS now passes all code checks.

Audit page 1

As reported:

1. Fix logo on scroll (make it static)

Fixed

What we found	Confirmed. The header scrolled away with the page, so the logo/menu disappeared as soon as you scrolled.
What changed	The header is now pinned to the top on every page and every screen size (desktop and phone). Only the pill and logo are solid; the band around them is transparent and clicks pass through it. In-page links (e.g. the quote button to the contact form) now stop below the header.

2. Header height is slightly big

Fixed

What we found	Confirmed.
What changed	Header reduced from 108 px to 92 px on desktop (logo badge 84 to 76 px, pill 48 to 44 px) and from 88 px to 76 px on phones.

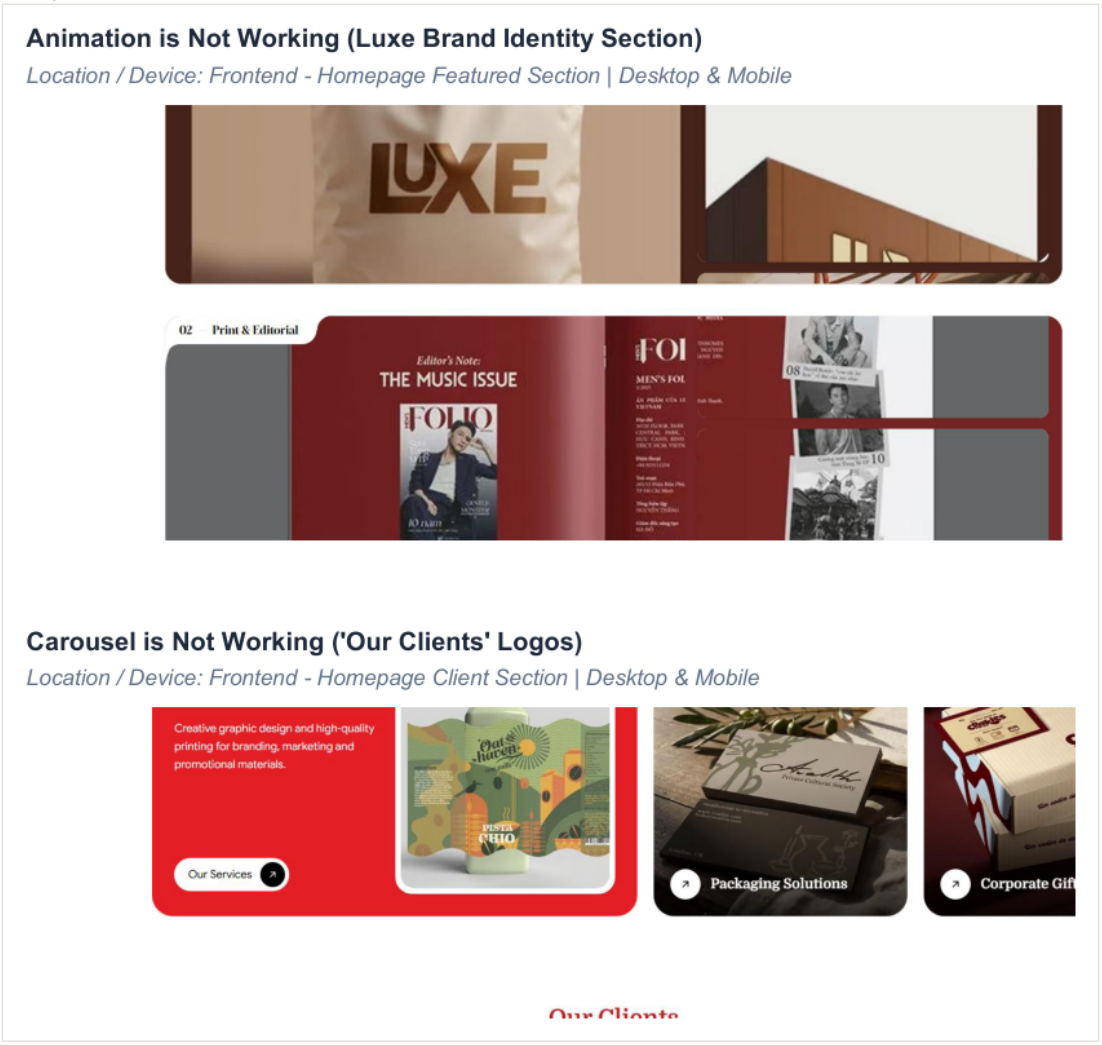

3. Homepage hero slider is not properly working

Fixed

What we found	Confirmed. The slideshow paused whenever the mouse was over it. Because the hero fills the first screen, the mouse is almost always over it, so for most visitors it never moved. On phones a tap counted as 'mouse over' and stopped it for good. There was also no swipe, and the arrows only appeared on mouse hover (never on phones).
What changed	Autoplay now always runs (it only pauses while a keyboard user is on its buttons). Swipe left/right works on phones, the arrows are visible on touch screens, the dots have bigger tap targets, and after a manual change the timer restarts so the next slide doesn't jump in immediately.

Audit page 2

As reported:

4. Animation is not working (Luxe / Brand Identity section)

Partly a bug – fixed

What we found	The animation itself works - verified running in Chrome at 1440 px and 390 px. Two real causes found: (1) on phones, tapping the block left it in a stuck 'hover' state, which pauses the moving reel permanently; (2) on devices where the user has turned animations off (iPhone: Settings > Accessibility > Motion > Reduce Motion; Windows: Settings > Accessibility > Visual effects > Animation effects), the site deliberately stops moving content.
What changed	Pause-on-hover now only applies to devices with a real mouse, so a tap no longer freezes it. Respecting 'Reduce Motion' is kept on purpose (accessibility requirement) - please re-test with that setting off.

5. Carousel is not working ('Our Clients' logos)

Partly a bug – fixed

What we found	Same two causes as above (stuck hover after a tap; 'Reduce Motion' on the test device). In addition the loop had a small visible jump each cycle.
What changed	Fixed the stuck hover and the loop jump. Devices with 'Reduce Motion' now see a neat, centred logo grid instead of a frozen, cut-off strip. The featured-work image row under it (reported on page 17) also scrolls by itself now.

Audit page 3

As reported:

Our Work Category Page - Grid Imbalance & Massive White Space

Location / Device: Frontend - Portfolio Category Page (/our-work/printed-materials)

01. Nura Candle Boxes

When a category has only 1 or 2 projects, the cards align strictly to the left edge, leaving a massive, glaring empty white space across the remaining 60% of the screen width.

Our Work Detail Page : Make Banner Small Size (Its Too Big)

Location / Device: Frontend - Single Project Detail Page (/our-work/.../...) | Desktop & Mobile

On individual project detail pages, the featured mockup banner image is excessively tall, filling the entire viewport and forcing project overview, client tags, and specifications far below the fold.

6. Our Work category page - grid imbalance & white space

Fixed

What we found	Confirmed. Cards were placed in a fixed 3-column grid, so 1 or 2 projects hugged the left edge.
What changed	Cards are now laid out in a centred row: 1 or 2 projects sit in the middle of the page; 3+ wrap normally.

7. Our Work detail page - banner too big

Fixed

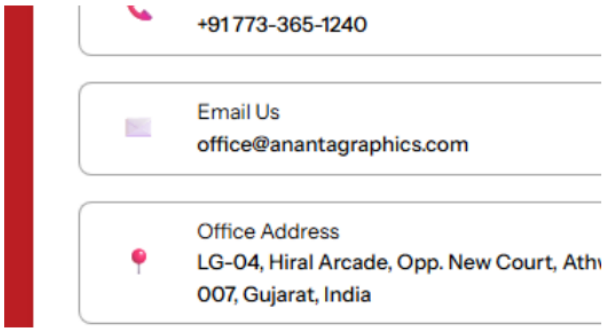

What we found	Confirmed. Gallery images used the full page width (about 1200 x 630 px on a laptop), filling the screen.
What changed	Gallery images are capped at about 900 x 505 px (16:9). The intro block is narrower, and on phones the title, description, client and services now come before the image, so they are visible without scrolling.

Audit page 4

As reported:

Phone Number Display - Add (+91) Country Code & Standardize

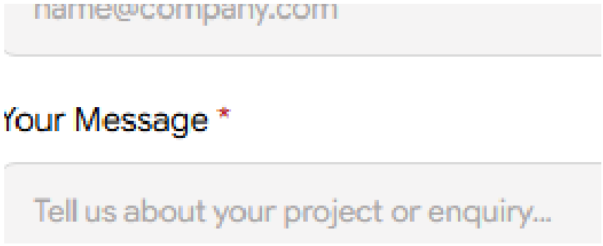

Location / Device: Frontend - Contact Us Card & Footer | All Devices

The contact number is displayed as '+91 773-365-1240' (a US Chicago area code prefixed awkwardly with +91) or '773-365-1240' in mobile drawers.

Add Services to Contact Form Dropdown

Location / Device: Frontend - Contact Form Dropdown | Desktop & Mobile

The 'Service Required' dropdown is missing several core company services (Packaging Solutions, Printed Materials, Signage & Display, Brand Identity, Pouches, Corporate Gifting).

8. Phone number display - add +91 & standardise

Partly a bug – fixed

What we found	The number shown is exactly what is saved in CMS > Settings > Contact details > Phone (currently 773-365-1240). 7733651240 is a valid 10-digit Indian mobile format (starts with 7); it was only written US-style. The phone drawer showed it without +91, and the code contained a hard-coded fallback number.
What changed	The number is now shown the same way everywhere as '+91 77336 51240' (footer, contact card, Get-in-touch card, phone menu, and a new call button in the phone header). The hard-coded fallback was removed. ACTION: if 77336 51240 is not the real office number, change it in CMS > Settings - the CMS now also warns if the number has fewer than 10 digits.

9. Add services to the contact form dropdown

Not a code bug – CMS content

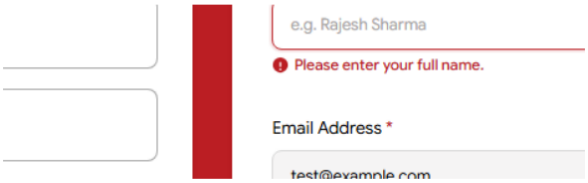

What we found	Not a code bug. The 'Service Required' list shows exactly the items in CMS > Services (the same list as 'Services We Provide' on the home page). The live CMS currently has only 'Designing & Printing' and 'Demo'. The audit's own CSV shows enquiries for 'Packaging Solutions' and 'Corporate Gifting', so those services existed and were later deleted or hidden.
What changed	ACTION: add Packaging Solutions, Printed Materials, Signage & Display, Brand Identity, Pouches and Corporate Gifting in CMS > Services (and delete 'Demo'). They then appear in the dropdown and on the home page carousel.

Audit page 5

As reported:

Add Validation in Phone Number (10 Digit) & Form Validations

Location / Device: Frontend - Contact Form | Desktop & Mobile

Submitting fewer than 10 digits triggers an error message that pushes the form elements down abruptly, causing layout shift. The input allows non-numeric characters.

Tablet Breakpoint Glitch - Dual Header Collision (768px - 1024px)

Location / Device: Frontend - Global Header | Tablet Viewport (768px)

At tablet width (768px), both the desktop red capsule navbar AND the mobile black hamburger icon ('≡') render simultaneously on top of each other on the upper left.

Mobile Header Misalignment & Asymmetry (390px Viewport)

Location / Device: Frontend - Global Header | Mobile Phones (390px)

On mobile screens, the desktop capsule navbar is compressed awkwardly. The hamburger icon is shoved to the far left, the logo is off-center, and the right half of the capsule is completely empty.

10. Phone validation (10 digits) & form validation / layout shift

Partly a bug – fixed

What we found	The website form already required exactly 10 digits for +91 and strips letters as you type (verified: typing '98a25' gives '9825'). The layout shift was real: each error message pushed the fields below it down.
What changed	Every field now reserves one line for its message, and the messages were shortened to fit on one line on a phone. Verified at 390 px: with all four errors showing, no field moves (0 px). Server-side checks were added too (see page 8).

11. Tablet breakpoint - dual header collision (768-1024 px)

Not reproducible / not a bug

What we found	Not reproducible. From 768 px up the code only renders the red capsule; the menu (hamburger) button is hidden. The '=' lines in the screenshot are the air-vent grille in the hero photo (the shop-front picture has a vent at its top-left; the same grille is visible on the Contact page hero).
What changed	No change needed. (The header is now pinned and slightly smaller, so the vent is less likely to sit right beside it.)

12. Mobile header misalignment & asymmetry (390 px)

Fixed

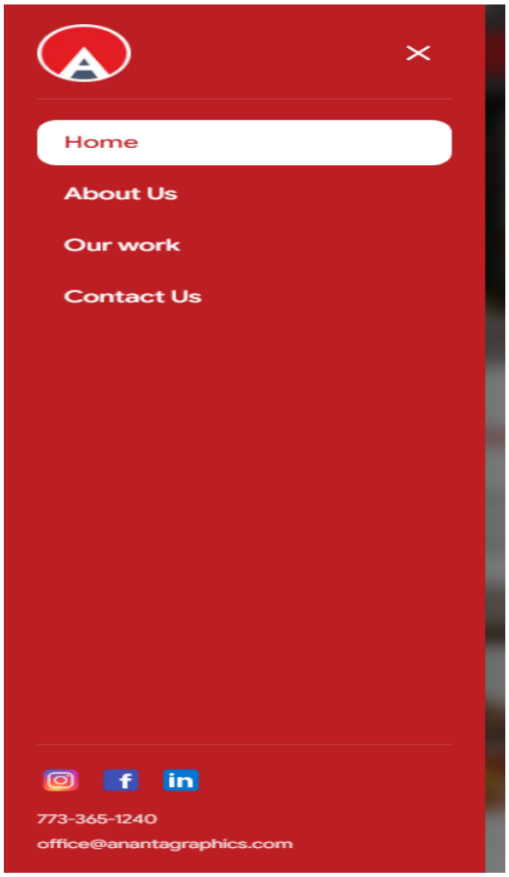

What we found	Confirmed: the right half of the pill was empty.
What changed	Added a call button on the right of the pill (menu | logo | call), so the logo is centred and both sides are used.

Audit page 6

As reported:

Mobile Navigation Drawer - Missing Country Code & Generic Links

Location / Device: Frontend - Mobile Menu Drawer | Mobile Phones

The slide-out drawer displays '773-365-1240' without '+91' country code, and social icons link to generic homepages. Top header bar remains visible behind the drawer backdrop.

13. Mobile navigation drawer - country code & generic links

Partly a bug – fixed

What we found	+91 missing: confirmed and fixed. Generic social links: the icons link to whatever is saved in CMS > Settings > Social media, which is currently the networks' home pages (e.g. https://www.instagram.com/) rather than the company's pages. Header behind the backdrop: by design the backdrop dims and blurs the whole page, including the header; verified it sits above the header.
What changed	Drawer now shows '+91 77336 51240' and the email with icons, plus YouTube when set. The CMS now refuses a bare home-page link and asks for the page's own address. ACTION: enter the real Instagram / Facebook / LinkedIn / YouTube page links in CMS > Settings.

Audit page 7

As reported:

CMS Login Page - Missing Show/Hide Password Toggle

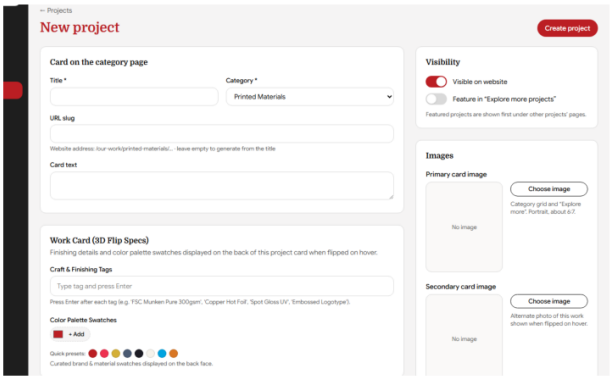

Location / Device: Admin CMS - Login Screen (/login) | Desktop & Mobile

The password field has no show/hide eye toggle button, leading to frequent login errors when administrators enter complex passwords with special characters.

CMS Projects - New Project Form Lacks Drag-and-Drop Image Uploader

Location / Device: Admin CMS - New Project Form (/projects/new) | Desktop

The Primary card image, Secondary card image, and Gallery sections only have basic 'Choose image' buttons with empty 'No image' boxes. No drag-and-drop zone or immediate live preview exists.

14. CMS login - show/hide password toggle

Fixed

What we found	Confirmed.
What changed	Added an eye button inside the password field (Show / Hide password).

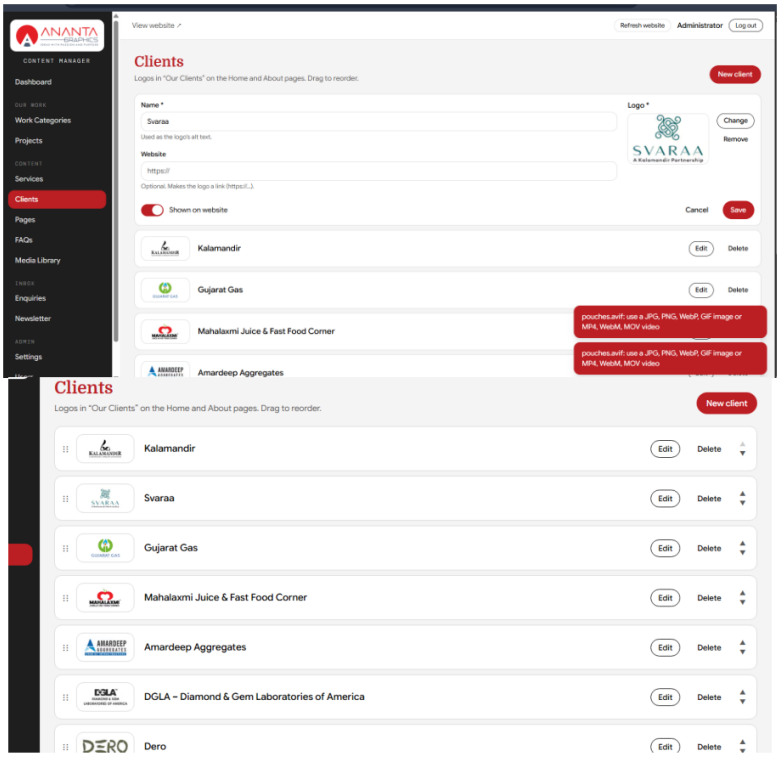

15. CMS projects - drag-and-drop image uploader

Fixed

What we found	Confirmed for the image fields in the project / category / service / client forms (the Media Library page and the image picker already had drag-and-drop).
What changed	You can now drop a file straight onto any image box (Primary, Secondary, Intro, logos...): it previews at once, uploads, and is selected. Clicking the box opens the picker. The Gallery accepts several dropped files at once.

Audit page 8

As reported:

Client logos appear in arbitrary upload order. The admin cannot specify which prestigious client logo appears first in the homepage carousel.

ID	Date	Type	Status	Name	Email	Phone	Service	Message	Notes
4	19-10-2026 09:19	contact	in_progress	Rudra	rudrasinh3115@gmail.com	'+91 8905050705	Packaging Solutions	other message	
3	19-10-2026 05:38	contact	new	Vrunda Lad	vrundalad49@gmail.com	8555	Corporate Gifting	Testing	
2	16-10-2026 18:19	contact	new	vrunda lad	vrundalad4099@gmail.com	123		testing	
1	16-10-2026 16:51	contact	new	vrunda lad	vrundalad4099@gmail.com	451236		testing	

Why this allow low 10 digit in phone numder

16. Client logo order

Not reproducible / not a bug

What we found	Already supported: CMS > Clients has a drag handle and up/down arrows, and the website shows logos in that order. It looked random because the home strip put the first half of the list in row 1 and the second half in row 2, and both rows keep moving.
What changed	The rows are now dealt in CMS order: client 1 starts row 1, client 2 starts row 2, client 3 is next in row 1, and so on - the clients ranked highest lead each row. Also from this screenshot: 'pouches.avif' was rejected. AVIF images are now accepted (converted to WebP automatically).

17. Why are phone numbers with fewer than 10 digits allowed?

Fixed

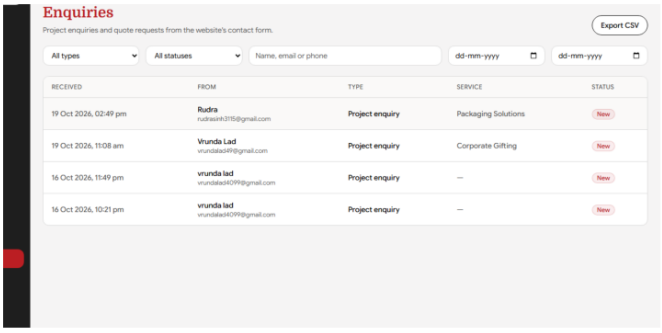

What we found	Confirmed on the server: the API only checked the characters, not the length. Entries like 8555, 123 and 451236 were saved (from before the website form validated, or sent to the API directly). The CSV also showed '+91... with a visible apostrophe.
What changed	The server now rejects anything that isn't a 10-digit Indian number (or 7-15 digits with another country code) and stores it as '+91 98250 12345'. The CSV export shows phones without the apostrophe. Existing bad rows stay as they were; they can be deleted in CMS > Enquiries.

Audit page 9

As reported:

CMS Enquiries - Missing 'Export to CSV' & Direct Email Reply Actions

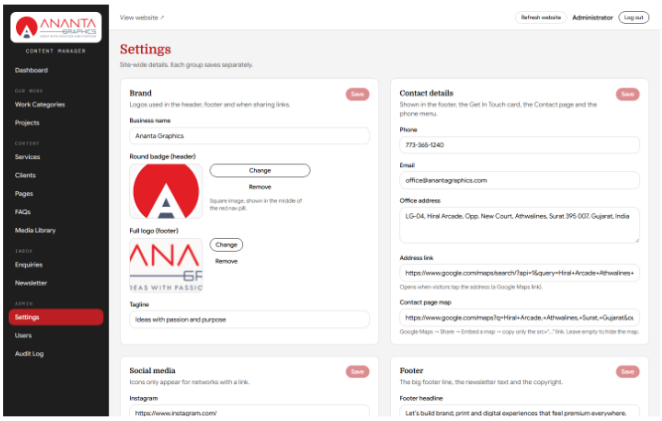

Location / Device: Admin CMS - Enquiries Detail (/enquiries/[id]) | Desktop

Admins can view customer inquiries from the contact form, but cannot export inquiries to CSV/Excel for sales follow-up, and there is no direct 'Reply via Email' button. That in click on client then show but that is too clicking process

CMS Settings - Social Media URLs in Admin Not Synced to Frontend

Location / Device: Admin CMS - Site Settings (/settings) | Desktop

In CMS Settings, fields exist for Instagram, Facebook, and LinkedIn links, but changes saved here do not update the frontend drawer and footer links.

18. CMS enquiries - Export to CSV & direct email reply

Partly a bug – fixed

What we found	Export CSV already existed (button at the top-right of Enquiries - visible in the audit's own screenshot, and it follows the filters). 'Reply by email' and 'Call' already existed on each enquiry's page; the request is to avoid the extra click.
What changed	Added 'Reply' (opens your email app with the subject filled in) and 'Call' buttons on every row of the Enquiries list.

19. CMS settings - social media URLs not synced to the website

Fixed

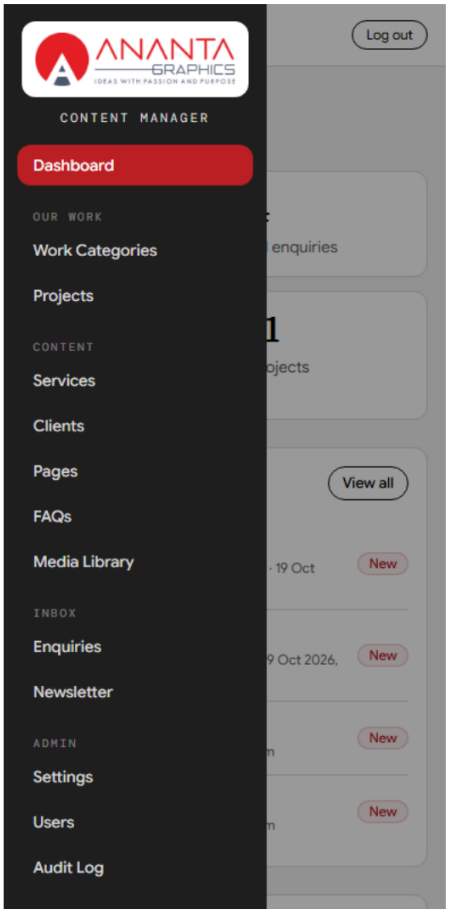

What we found	Confirmed, most likely a server setting. CMS edits are saved correctly, then the server tells the website to refresh. In production the website runs on port 3100, but the setup left that refresh address pointing at the development port 3000, so the call failed silently and the live site kept showing its cached copy for hours. (The values saved there are also generic home pages - see page 6.)
What changed	Setup now writes the correct production address, and the CMS 'Refresh website' button now shows an error if the website can't be reached, instead of pretending it worked. ACTION ON THE SERVER: in backend/.env set REVALIDATE_URL=http://127.0.0.1:3100/api/revalidate, then restart the API (pm2 restart ag-api ag-admin-api).

Audit page 10

As reported:

CMS Mobile View - Sidebar Overlay Tap-to-Dismiss Glitch

Location / Device: Admin CMS - Mobile Navigation Drawer | Mobile (390px)

When opening the mobile sidebar in the CMS, tapping outside the drawer does not reliably close the menu on certain mobile devices.

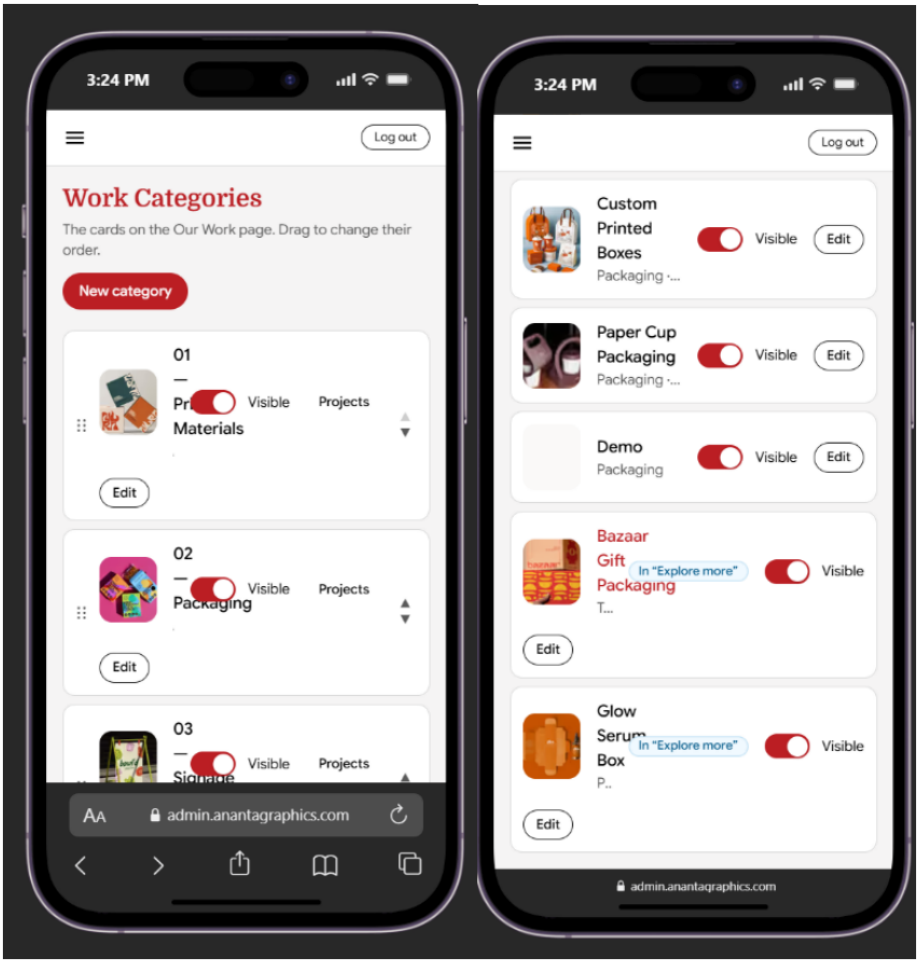

20. CMS mobile - sidebar tap-to-dismiss

Fixed

What we found	Partly reproduced: the backdrop only closed on a completed 'click', which some phones drop when the touch turns into a scroll; the page behind could also scroll.
What changed	The menu now closes on the first touch outside it, locks the page behind while open, has its own close (X) button, closes with Esc, and closes automatically when you open a page.

Audit page 11

As reported:

Ui problem

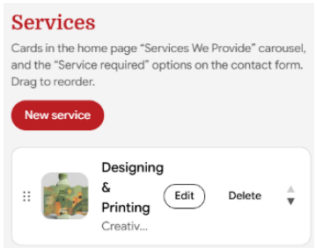

21. CMS mobile - Work Categories / Projects rows (UI problem)

Fixed

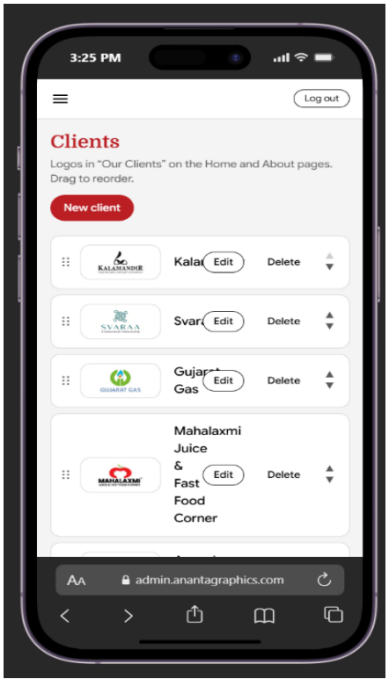

What we found	Confirmed: on phones the name, switch and buttons were squeezed into one line, so titles broke into single words and overlapped the 'Visible' switch.
What changed	On phones each row now shows the picture and name on one line and the switch / Projects / Edit buttons on the line below. Desktop is unchanged.

Audit page 12

As reported:

that scroll to up and down not working

Ui problem

22. CMS Services - scrolling up and down not working

Fixed

What we found	Confirmed. Every row was 'draggable' (for drag-to-reorder), and on phones that captured the finger, so swiping on the list didn't scroll the page.
What changed	Rows can now only be dragged by the handle, with a mouse. On phones you scroll normally and reorder with the up/down arrows.

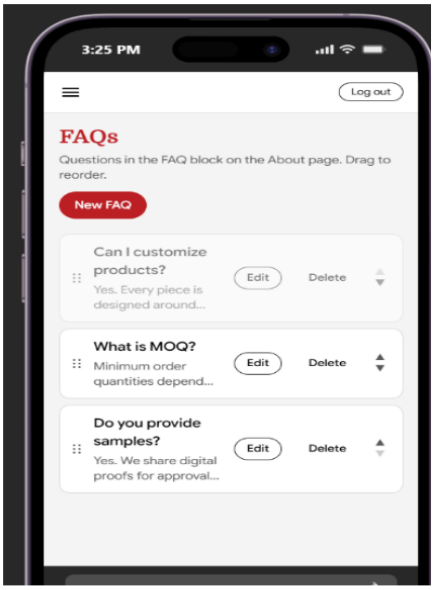

23. CMS Clients - UI problem

Fixed

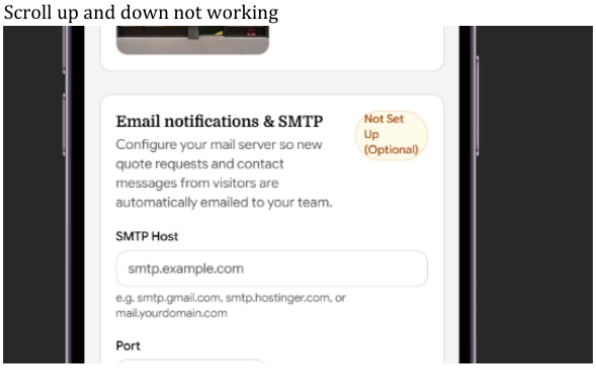

What we found	Confirmed: the Edit button covered the client name.
What changed	Name on its own line, Edit / Delete below it on phones.

Audit page 13

As reported:

Scroll up and down not working

Ui not proper

24. CMS FAQs - scrolling up and down not working

Fixed

What we found	Same cause as Services (page 12).
What changed	Same fix.

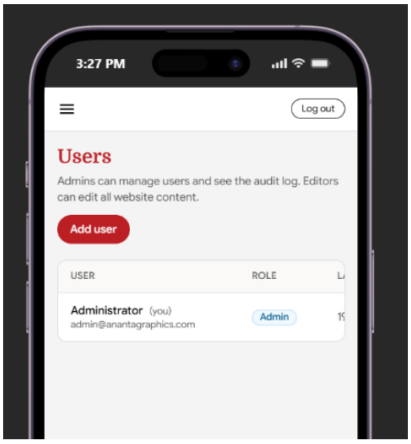

25. CMS Email notifications panel - UI not proper

Fixed

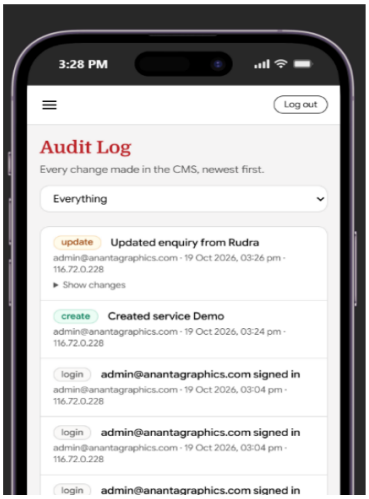

What we found	Confirmed: the 'Not Set Up (Optional)' badge was squeezed into a narrow column beside the title.
What changed	Panel headers now wrap on phones: the badge sits on one line under the title. Badges never break mid-word.

Audit page 14

As reported:

Ui not perfect

Make this ui ux easy to understand

26. CMS Users - UI not perfect

Fixed

What we found	Confirmed: the table was cut off on phones (Last sign-in and buttons hidden off-screen).
What changed	On phones each user is a card: name, email, role, last sign-in, Edit / Delete. Desktop keeps the table.

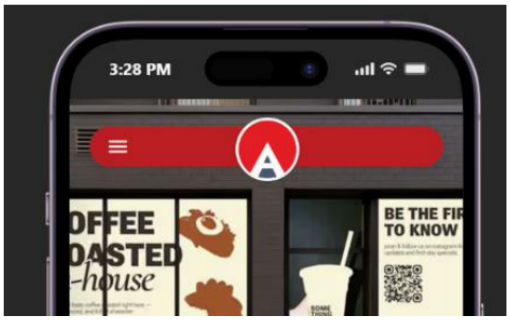

27. CMS Audit Log - make it easy to understand

Fixed

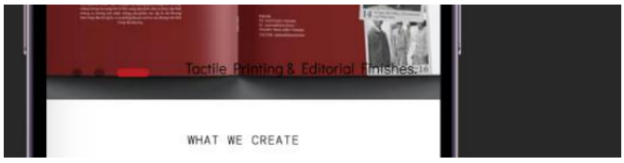

What we found	Confirmed: technical labels (update / create / login), IP addresses in every line, and frequent sign-ins burying the actual changes.
What changed	Plain words ('Added', 'Edited', 'Deleted', 'Reordered'), 'by - ' under each entry, 'See what changed' shows old -> new values with readable field names, and IP addresses moved into those details. Sign-ins are hidden by default (the filter can show them), and the filter uses plain names like 'Only projects'.

Audit page 15

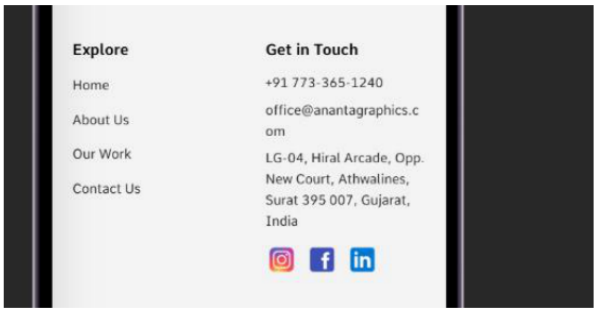

As reported:

Fix this logo not hover

See there is text

Need to add icons like phone calling emails location and add there location link click to location open

28. Fix this logo (hover) on mobile

Fixed

What we found	Confirmed. The logo's 'magnetic' hover effect reacted to taps and, since a phone never sends 'mouse left', it could stay pulled off-centre.
What changed	The effect now only reacts to a real mouse (applies to all such effects on the site).

29. 'See there is text' - hero caption

Fixed

What we found	Confirmed. On phones the slide caption ran into the slide dots, and on dark slides the dark text was hard to read.
What changed	On phones the caption sits above the dots (dots centred at the bottom). The caption has a soft light background, so it's readable on every slide.

30. Footer - add phone / email / location icons and a location link

Fixed

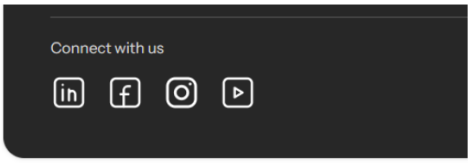

What we found	Confirmed for the icons. The address was already a link to Google Maps, but nothing showed it.
What changed	Phone, email and location icons added in the footer (and the contact cards use the same icons instead of emoji). The address opens Google Maps.

Audit page 16

As reported:

This not scroll and work

Why thia ahow here youtube link and in footers not

31. Services carousel on mobile - 'not scroll and work'

Partly a bug – fixed

What we found	Swiping did work, but the live site has only 2 services (one is 'Demo'), so there is almost nothing to scroll, and there were no arrows on phones.
What changed	Arrows now show on phones too and step through the services, cards snap into place, and a tapped card scrolls into view. Adding the real services in the CMS (page 4) will fill this section.

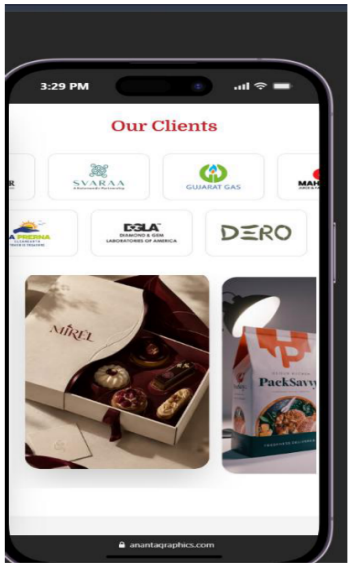

32. Why is YouTube in 'Connect with us' but not in the footer?

Fixed

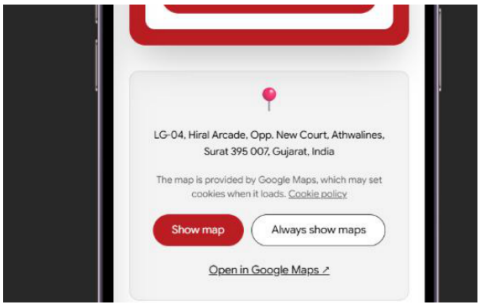

What we found	Confirmed: the footer / contact-page icons didn't support YouTube.
What changed	YouTube now appears everywhere the other social icons do (footer, phone menu, contact page) when a link is set.

Audit page 17

As reported:

This section also not work

This not need if you give location on this box

33. Our Clients / featured images section (mobile) - 'also not work'

Partly a bug – fixed

What we found	Logos: see page 2. The image row below them was a static row you had to swipe, so it looked broken.
What changed	The featured image row now glides by itself in a loop (pauses under the mouse; with 'Reduce Motion' it's a swipeable row).

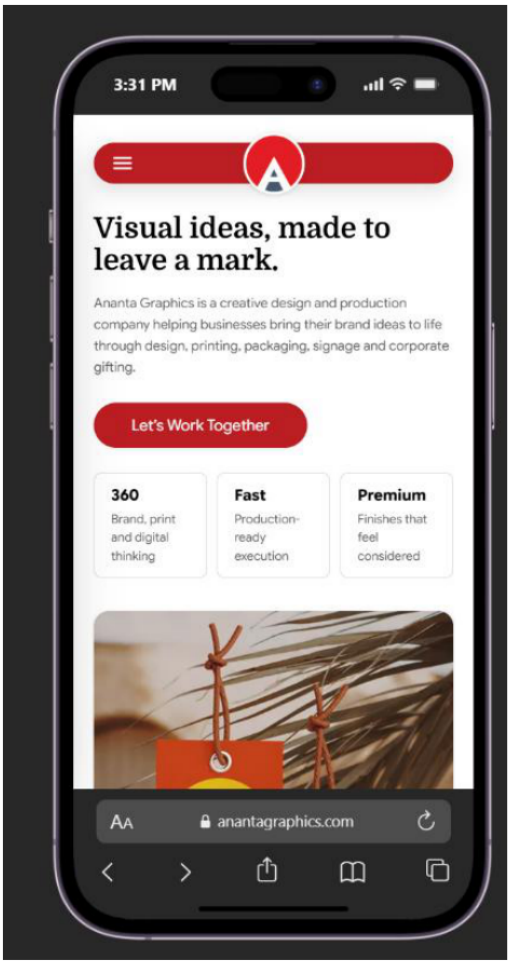

34. Map box not needed if the location is in the address box

Fixed

What we found	Agreed - the map consent box repeated the address.
What changed	Removed the map box from the Contact page. The 'Office Address' card now says 'Open in Google Maps' and opens the location. The cookie policy was updated, and the unused 'Contact page map' field was removed from CMS Settings.

Audit page 18

As reported:

when we scroll make logo on top not invisible because if views can go on home so just click and go

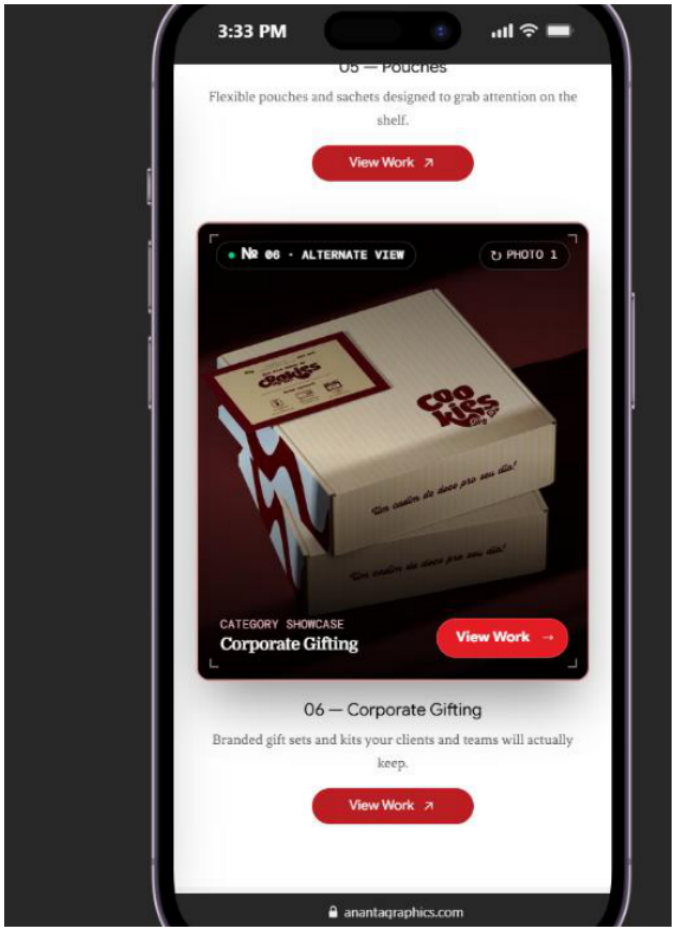

35. Logo should stay visible at the top while scrolling (mobile)

Fixed

What we found	Same as page 1.
What changed	The header with the logo stays pinned at the top on phones too; tapping the logo goes Home.

Audit page 19

As reported:

There is multiple view work link that look not professional and it show most up focus on that view more button

36. Multiple 'View Work' links look unprofessional

Fixed

What we found	Confirmed. Tapping a card on a phone flipped it, showing a second red 'View Work' button plus 'ALTERNATE VIEW' and 'PHOTO 1' badges - on top of the 'View Work' button under the card.
What changed	The card no longer flips on phones (tapping opens the work). On desktop the flip shows only the second photo and the title. There is now exactly one 'View Work' button per card.

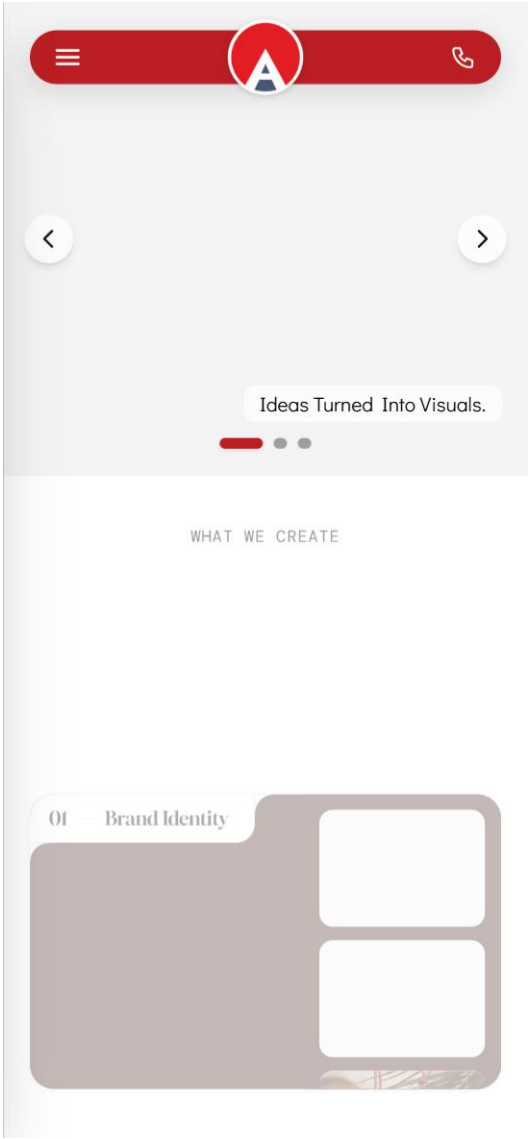

After the fixes - screenshots

Taken on the development build with the same content as the live site (local data has 4 services and the seed client logos).

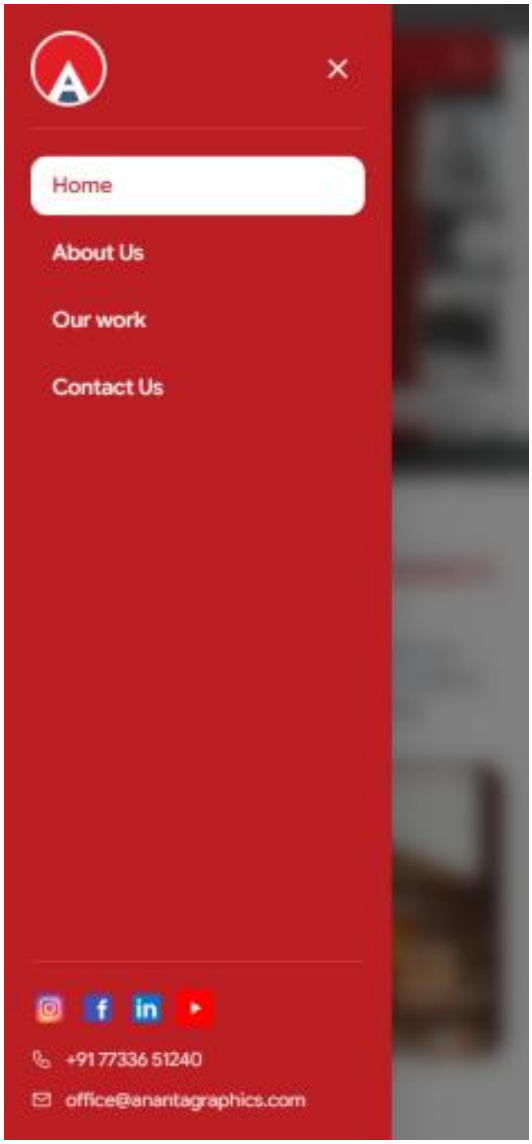

Home, 1440 px: pinned smaller header, readable slide caption

Home, 390 px: balanced pill (menu | logo | call), caption above the dots

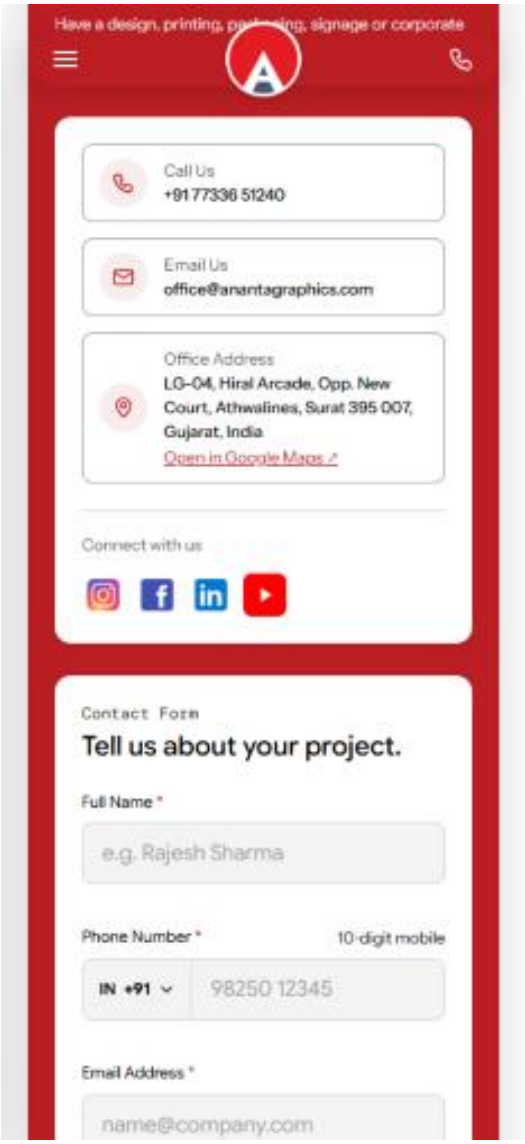

Phone menu: +91 number, icons, YouTube

Services on a phone: arrows step to the next service

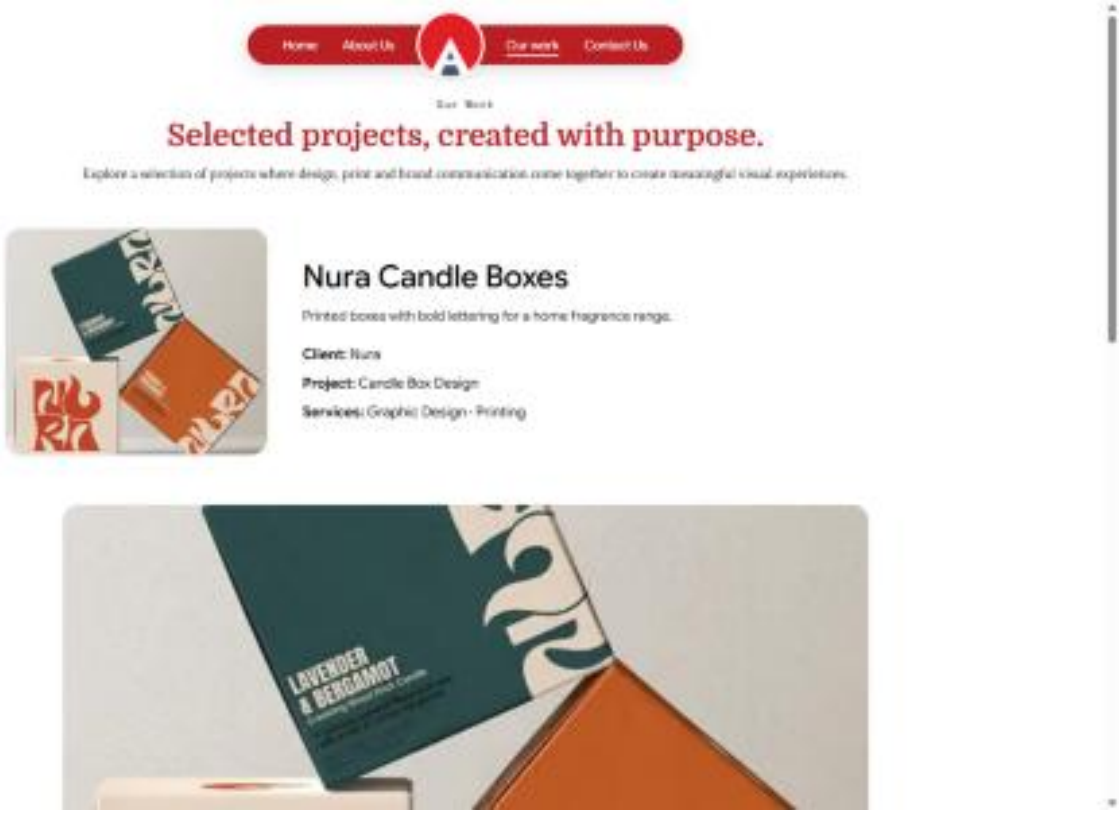

Contact page: icons, 'Open in Google Maps', no separate map box

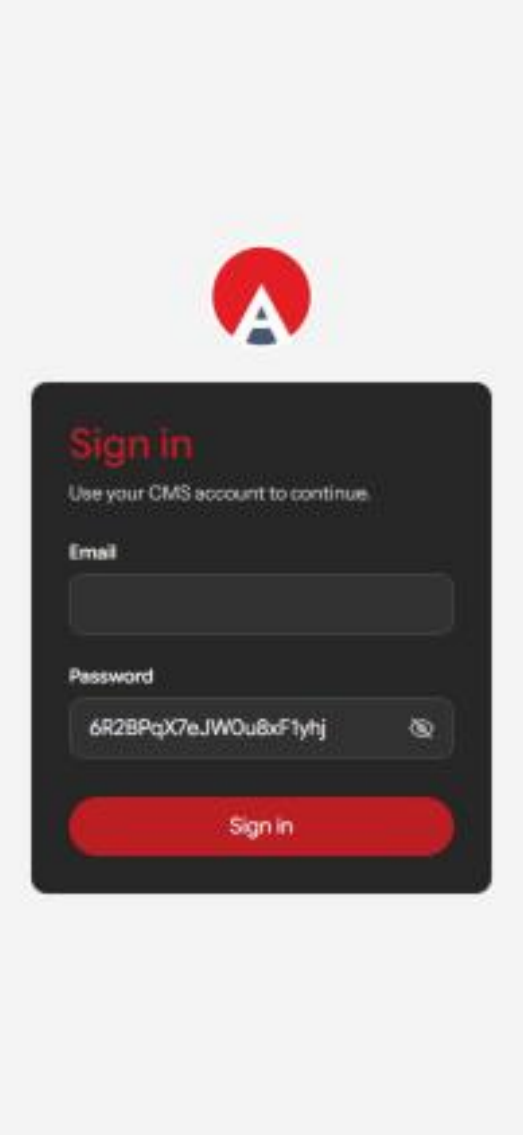

Category with one project: centred

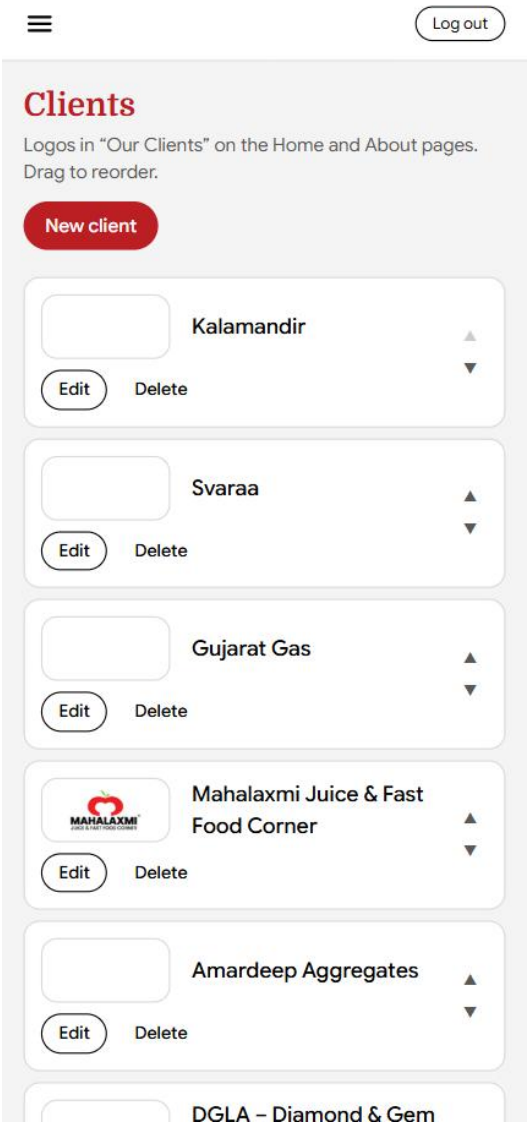

Project page: details visible, smaller gallery image

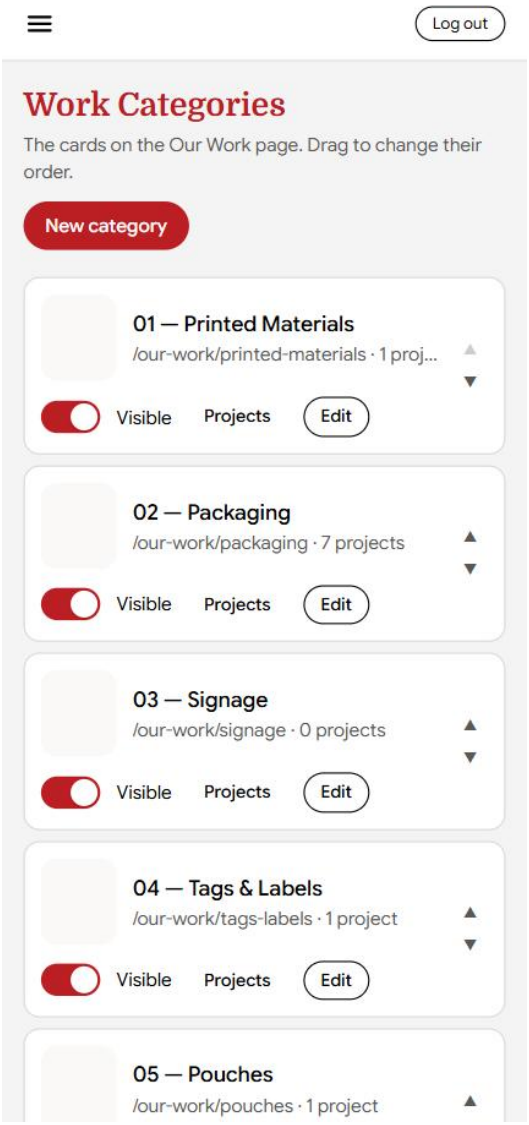

CMS login: show / hide password

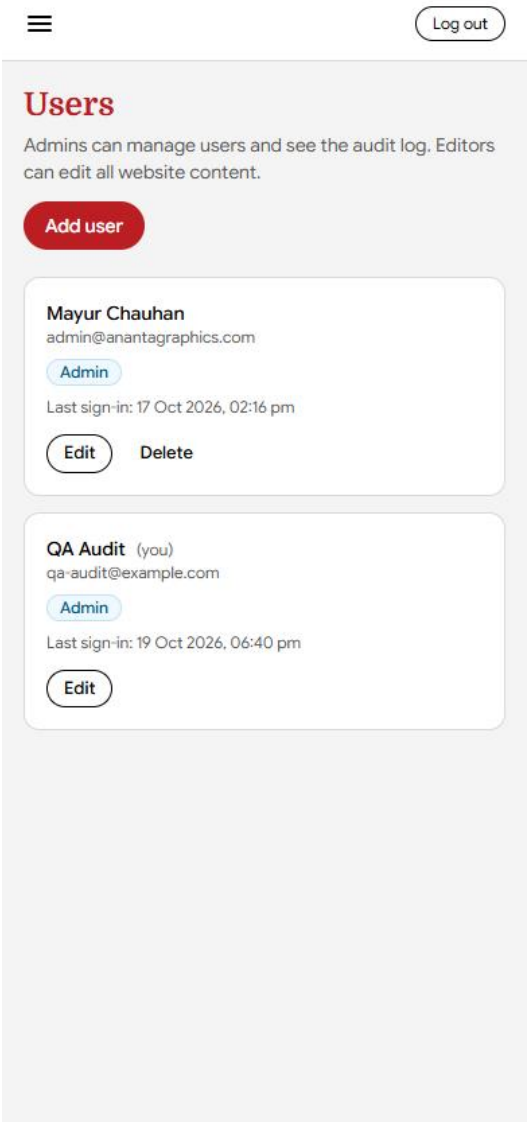

CMS Clients on a phone

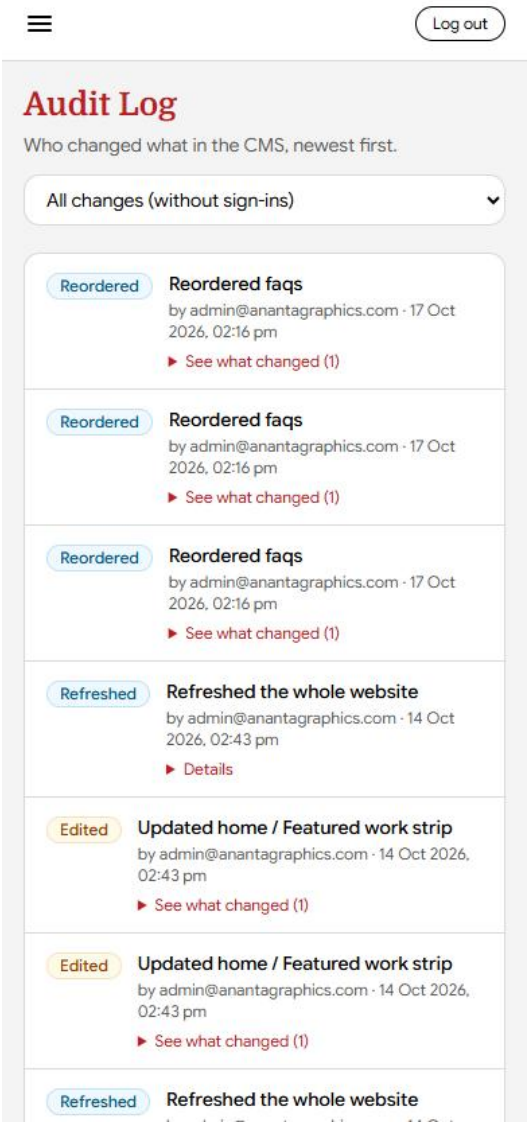

CMS Work Categories on a phone

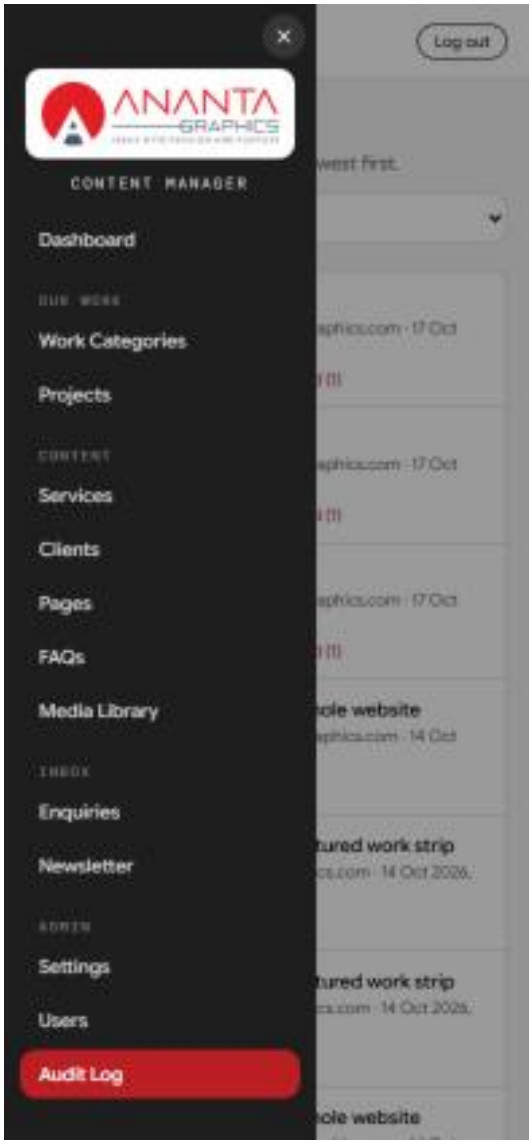

CMS Users on a phone

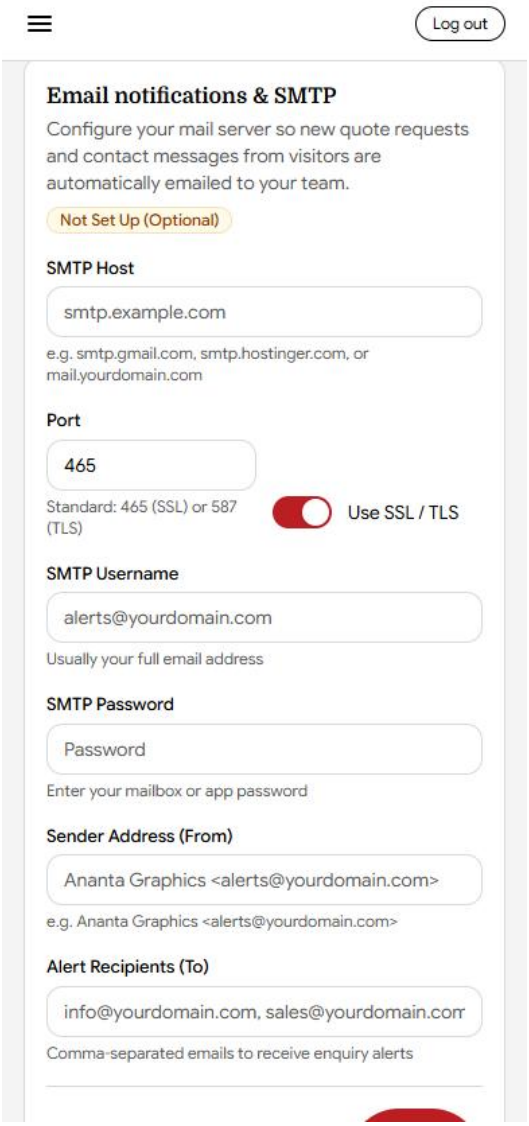

CMS Audit Log on a phone

CMS menu with close button

CMS Email panel on a phone

CMS New project: drop zones on image boxes
